## Adjustment instruction of standard used hinges

- A - Oval opening that serves for fastening the hinge to the leaf and for adjusting it up and down (making the top gap even)
- B - Bolt for hinge adjustment right and left (making leaf's side gaps even)
- C - Bolt for hinge adjustment front and back (making the leaf flush with wall surface)
- D - Bolt serving for unlocking/locking the position set by C bolt
- E - Round opening that serves for fastening the hinge to the door frame

1. In order to adjust the leaf height (decrease or increase the top gap), loosen screws in openings [A] that hold all hinges in the leaf.

2. Using a wedge (an adjustment washer for doors), lift the door to the desired height in such a way that the gap between the door frame and the leaf is about **3 mm**. Then tighten all hinges to the leaf.

The range of hinge adjustment is **5 mm** from its lowest position.

3. In order to adjust the leaf so that its surface is flush with the wall surface, first loosen [D] bolts.

4. Then move the leaf closer to or farther from the door frame by rotating [C] bolt. After adjusting the hinges in this plane appropriately, again tighten [D] bolts to lock the position.

The range of hinge adjustment in this plane is **+/-1 mm.**

5. In order to adjust the gaps between the leaf and the door frame on the sides, tighten or loosen [B] bolt in the hinge, which makes the leaf move right or left.

The range of hinge adjustment in this plane is **+/-1.5 mm.**

Adjust all hinges evenly so that none of them is overloaded, which will prevent their damage.
